SYSTEMS AND METHODS FOR PROVIDING CENTRALIZED MANAGEMENT OF HETEROGENEOUS DISTRIBUTED ENTERPRISE APPLICATION INTEGRATION OBJECTS

ABSTRACT OF THE DISCLOSURE

In the distributed enterprise application integration system, modularized components located on multiple hosts are centrally managed so as to facilitate communication among application programs. Collaboration services traditionally associated with a central server, such as, for example, message queues, message publishers/subscribers, and message processes, are instead distributed to multiple hosts and monitored by a central registry service. This system allow configuration management to be performed in a central location using a top-level approach, while implementation and execution tasks are distributed and delegated to various components that communicate with the applications.
